

Struggling with Tourette Syndrome?

The D1AMOND study is researching Tourette's Syndrome (TS) in children 6 to 17 years of age.

Protocol number: EBS-101-CL-001

If your child has TS, you know that physical (motor) and verbal (vocal) tics can be frustrating because they are unpredictable and disruptive. No matter how often tics happen or how intense they are, they can be difficult to diagnose and manage.

This study is researching an investigational drug (a "selective D1 dopamine receptor blocking agent") called ecopipam to find out if it works in children and adolescents age 6 to 17 years of age with TS.

To be eligible for this study, your child must:

- Have signed written informed consent from a parent or legal guardian
- Sign a written informed assent
- Be 6 to 17 years of age
- Be diagnosed with TS
- Have both motor and vocal tics that interrupt normal routines

This is not a complete list of study requirements. The study doctor will review the full criteria for this study with you. You do not have to pay for the study drug, study supplies, study visits, or tests that are part of the research study.

Ask your doctor if your child may be eligible for this study.
